

**Blastrac introduces new machine – BMP 265 Scarifier**

Blastrac systems are the preferred and chosen method for surface preparation and the company is greatly trusted and respected by professional contractors who recognise the limitless benefits of its products.

The company offers a large portfolio of surface preparation machines, which perform jobs such as shot-blasting, grinding, polishing, coatings removal and many more on concrete, asphalt, stone and even steel. Each machine has an adapted dust collector which makes Blastrac products environmentally friendly and ecologically conscious.

Blastrac began manufacturing the new BMP 265 scarifier in September 2008.

The machine is available in an electric version with a 5.5 kW electric motor or petrol version with a 5.9 kW motor. The working width is 265mm and it has more weight than its predecessors, including stronger drum axles.

The BMP 265 has many benefits, as far the end user is concerned: the machine can handle more square meters per hour and is easier in use, because of the new break system; it decreases back complaints drastically. During scarifying, the machine slows down itself. Brake force is easily changed with a handle on the steer.

Furthermore, the machine is easy to move and has low vibrations.

The working areas suited for the BMP 265 are e.g. industrial flooring, concrete floors, road maintenance, shipyards and airports.

Finally, consumables such as milling cutters, TCT tipped cutters and spacers etc. are fully interchangeable with those used on our bigger scarifier the BMP-335EHY/GHY.
