

KDH are in final phase of fast-track Morrisons refurbishment

KDH Projects is in the final stages of factory refurbishment at Morrisons Deeside. The food industry construction company began the project at the end of July and will complete it just eight weeks later, at the end of September.

The project took place in high and low care areas of the factory, removing old flooring, drainage, walls and freezers and replacing them, creating a better, more hygienic factory environment.

The existing flooring has been taken up, new stainless steel drainage systems fitted and KDH's own brand of polyurethane resin flooring, Food-Crete™ has been laid throughout the high and low care areas.

Fast curing, durable and hygienic, Food-Crete™ is a polyurethane resin flooring system created specifically for the food industry. The low odour, non-tainting formula enables KDH to lay flooring in live production areas without evacuation and the quick curing time causes minimal disruption.

Two new chillers have been installed on the site and stainless steel sheeting and barriers fitted into an existing blast freezer.

White-walling panels have been fitted to the walls and ceilings to maintain optimum hygiene levels throughout the premises.

Each team of staff at KDH are specialist in a particular area; building and maintenance, flooring and drainage, cooling and ventilation or electrical and mechanical works. They have been working together, around the clock to ensure the fast-track task will be completed on time, to the usual high standards displayed by KDH.
