

## **Prestec give it the works at Caparo**

Caparo braking systems based in Leamington Spa approached Prestec UK specialist contractors with a flooring problem.

An area of floor in their engineering workshop had become so badly worn the surface was damaged, uneven and unsafe to work on. Prestec had a five day window to prepare, repair and install a new resin floor finish and recommended a Remmers UK material specification.

The whole area was shot blasted and diamond grinded

back to sound concrete, then repaired with Remmers primer MT and EP Screed. On completion of preparation and repairs the whole area was scratch coated and primed with Remmers primer MT with a fine broadcast of 0.1mm – 0.3mm quartz aggregate.

Once cured a Remmers' Epoxyflex PH self levelling screed was laid to the whole area. As this is an engineering workshop heavy machinery traffic and oil spillages were inevitable, with this in mind Prestec mirrored through the screed the expansion joints and installed a new single pack polyurethane joint sealant. To complete the package a Remmers arti-top m plus finish with the addition of polymer beads to achieve a slip resistant finish.

Paul Stack – Caparo engineering manager said; 'The service we received from Prestec UK was second to none, we received constant help on devising a solution to our problem and programming in the project. The works started and finished on time with no problems what so ever and the operatives on site were excellent. The finished product in our workshop exceeded our expectations, fantastic job!'
