

SEAMLESS FINISH PUTS RESDEV IN THE SWIM

Resin flooring systems developed by specialists Resdev Ltd have been specified within a pool and poolhouse area to create an elegant and practical seamless surface complete with inherent slip and skid resistance, providing a hygienic, safe solution for this leisure environment.

Traditionally, more conventional tiling systems have been used in pools and pool areas, offering satisfactory levels of performance. However, deterioration of grouting can produce ongoing maintenance problems, whilst slip resistance is a significant safety concern.

Specialist systems developed by Resdev have effectively overcome these issues. The seamless finish provided by the company's resin-based

products offer inherent levels of slip and skid resistance, plus the added benefits of high levels of resistance to UV light, abrasion/impact resistance and longevity in use.

Approved Resdev applicator Ultrasyntec Ltd installed the system across the entire pool and poolside area, beginning with Resdev's DPM Primer, a solvent-free damp proof membrane designed for use over cementitious surfaces.

This was followed by two coats of a polyurethane resin system incorporating blue and white flakes to achieve the required aesthetic effect, and finished with a special topcoat guaranteeing high levels of resistance to UV light.

The end result is a seamless finish spanning the entire poolhouse area, both inside the pool and across the pool surrounds, achieving an elegant and uninterrupted finish combining the highest levels of performance and safety.
