

New SPE 316 Dust Collection Unit

SPE have developed a 3-phase version of the companies popular 316 single phase unit. The new dust collector has a powerful 4kw 415v motor and has been designed to cope with the high volume of dust created by larger surface preparation equipment. The new unit is fitted with clear flow PTFE filters as standard with an optional hepa filter also available. Standard hose connection is 70mm however a 50mm adaptor can be used to suit the particular application. Careful consideration was given in the design process to ensure the finished machine was compact and easy to transport. The overall height is just 1.4 metres, hence able to fit easily into most commercial vehicles.

Another benefit is a 415v power take off from the unit allowing both the dust collector and connected surface preparation machine to be powered from just one mains socket.

Noise levels are also low when compared to single-phase dust control vacuums.
