

Sika Limited Press Release

Sik061 Pronto
December 2005

Sikafloor supply 24-hour flooring solution

"We need a new, very tough, slip resistant floor for our warehouse but you only have 24 hours to get it done." That was the demand from a national distribution company needing a rapid response to their problem of badly worn concrete aisles and walkways.

Sikafloor Pronto was the solution. Probably the fastest curing flooring screed material available, Sikafloor Pronto is a 3-part, multi component system based on polymethyl methacrylic (pmma) – superglue technology.

In average temperature conditions Sikafloor Pronto can be walked on just one hour after application and achieves full cure after two hours. It can be applied even in freezing conditions when a four hour cure can be expected.

The two part resin/hardener mix is boosted by broadcasting quartz aggregate between coats which creates the slip resistant surface. Coloured chips may also be added to the aggregate creating a more aesthetic appearance.

From start to finish, the total floor surface refurbishment application was completed within 24 hours causing minimum disruption to the distribution activity.
